TYPE OF DATASTORE IN VMware ESXi 8.0

TYPE OF DATASTORE IN VMware ESXi 8.0

Datastore Type	Description
VMFS (version 5 and 6)	Datastores that you deploy on block storage devices use the vSphere Virtual Machine File System (VMFS) format. VMFS is a special high-performance file system format that is optimized for storing virtual machines.
NFS (version 3 and 4.1)	An NFS client built into ESXi uses the Network File System (NFS) protocol over TCP/IP to access a designated NFS volume. The volume is located on a NAS server. The ESXi host mounts the volume as an NFS datastore, and uses it for storage needs. ESXi supports versions 3 and 4.1 of the NFS protocol.
vSAN	vSAN aggregates all local capacity devices available on the hosts into a single datastore shared by all hosts in the vSAN cluster. See the Administering VMware vSAN documentation.
vVol	Virtual Volumes datastore represents a storage container in vCenter Server and vSphere Client.

TYPE OF DATASTORE IN VMware ESXi 8.0

As you all know that storage means a place where you can store your digital data, database, or any virtual machine.

There are three categories of Storage: -

- **Direct Attached Storage (DAS)** Direct Attached Storage is known as local storage which is connected with your host.
- **Network Attached Storage (NAS)** Network Attached Storage is known as network storage which is connected with your host in network but, here you use the file system another such as FAT, NTFS or ext3, 4.
- **Serial Attached Storage (SAN)** Serial Attached Storage is also known as network storage which is connected with your host in network but, here you use the raw storage and you make it in VMFS. This storage is very fast.
